Are beyond-Li-ion energy storage technologies safe?

Safety and degradation of beyond-Li-ion technology: Many emerging energy storage technologies are presented as 'safer' alternatives to Li-ion systems. Full, rigorous FMEAs still need to be completed for these new technologies to understand their unique safety and degradation profiles.

What happens if an energy storage system fails?

Any failure of an energy storage system poses the potential for significant financial loss. At the utility scale, ESSs are most often multi-megawatt-sized systems that consist of thousands or millions of individual Li-ion battery cells.

What's new in energy storage safety?

Since the publication of the first Energy Storage Safety Strategic Plan in 2014, there have been introductions of new technologies, new use cases, and new codes, standards, regulations, and testing methods. Additionally, failures in deployed energy storage systems (ESS) have led to new emergency response best practices.

What are non-electrochemical energy storage deployments?

Summary of non-electrochemical energy storage deployments. Pumped hydro storage plants store and generate energy by moving water between two reservoirs at different elevations. Water is pumped into an upper reservoir for charging and then released through pipes into turbines for discharging.
