How does VENSYS cool a generator?

To prevent damage to the generator, the heat must be dissipated. To do so, VENSYS relies on a simple yet efficient air cooling method. The generators of the 1.5 MW platform are cooled using a passive, maintenance-free air circulation system without any moving parts.

What is static reactive power generator SVG?

In recent years, the rapid development of the static reactive power generator SVG device represents the latest reactive power compensation system. It has a rapid response, wide operating range, and can suppress voltage flicker, but its complex structure and high cost make it difficult to be used on a large scale.

What are the advantages of SVG & SC combination?

Therefore, compared with other reactive power compensation programs, the SVG + SC combination has obvious advantages in transient voltage stability. It is also more suitable to adopt the proposed reactive power compensation combination program where the voltage is weaker in the wind power gathering area.

Why is SVG a good choice for reactive power compensation devices?

The SVG has the characteristics of fast and smooth adjustment, and the application of the capacitor bank reduces the overall investment cost and has a great economy. The modal analysis method was used to find the optimal installation position for the reactive power compensation device.

The core function of the SVG in a wind farm is to replace traditional capacitor/reactor banks (TSC/TCR) to provide fast, smooth, and continuous reactive power ...

Engineered Solutions for a Perfect Application Fit specific requirements and challenges. AKG's engineering and design teams are well trained and experienced to create cooling systems that ...

According to the characteristics of offshore wind power generation, FGI has developed a special static var generator (SVG), which is a completely closed device that ...

The invention relates to the technical field of cooling of wind power plants, in particular to an air cooling structure of a SVG (static var generator) room of a wind power plant...

When the grid voltage swells or drops, the SVG has a sufficient reactive power reserve to support the grid quickly. This paper utilizes a regional power grid incorporating two wind farms ...

The generators of the 1.5 MW platform are cooled using a passive, maintenance-free air circulation system without any moving parts. The ...

According to the characteristics of offshore wind power generation, FGI has developed a special static var generator (SVG), ...

This article will systematically analyze the maintenance and care strategies of SVG from multiple dimensions, including environmental adaptability, operational specifications, fault prevention, ...

Coupled simulations of heat transfer and flow as well as experiments were carried out to develop a new type of passive cooling system for gearless wind turbines with a power ...

The generators of the 1.5 MW platform are cooled using a passive, maintenance-free air circulation system without any moving parts. The ambient air is directed through special ...

In summary, in order to solve the problem of weak voltage support in wind power gathering areas, considering the continuity and smoothness of regulation in reactive power ...

Our ACTIVEPHASE series Static Var Generator (SVG), is a reactive power compensation system, used for compensation of normal or dynamic three-phase, balanced or unbalanced ...
