---

I have a VirtualBox process hanging around which I tried to kill (KILL/ABORT) but without success. The parent pid is 1 (init). top shows the process as D which is documented as ...

By integrating technologies like uninterruptible power supplies (UPS), battery energy storage systems, and automated control, you ensure that mission-critical loads remain ...

Yes, you must call `set_current_state()` before calling `schedule()`, because otherwise the scheduler will not remove the task from the run queue (if you just want to ...

An uninterruptible process is a process which happens to be in a system call (kernel function) that cannot be interrupted by a signal. To understand what that means, you need to understand ...

As you could read from that answer, setting the current process state to `TASK_UNINTERRUPTIBLE` is needed for make `schedule()` call, performed by that thread, to ...

When looking at the process with `&quot;ps ax&quot;`, the stat column is `&quot;Dl&quot;`, which means `&quot;uninterruptible sleep (usually IO)&quot;`. Is it possible to find out more details on what the process is ...

UPS systems are supplied by manufacturers as all-in-one fully housed (and turnkey) components; UPS electronics and charger integrated into one product, but the battery sold separately; and ...

Smaller power requirements are often handled by single-phase designs, whereas greater power requirements are handled by three-phase systems since UPS systems are designed to ...

I understand these are uninterruptible sleep states often related to waiting for data from hardware such as a hard disk. This is a production server so rebooting is a very last ...

To ensure uninterrupted power supply, uninterruptible power systems (UPS) and energy storage systems are used. UPS and energy storage systems are two different ...

The man page says what the state codes are mapped to, but not what they actually mean. From the top man page: "D" = uninterruptible sleep "R" = running "S" = sleeping ...

To address these challenges, this study proposes a three-level optimization framework that integrates energy storage-enhanced uninterruptible power supply (EUPS) with ...
